

# Different sorts of sprite sheets

There are different sorts of *sprite sheets*. See some examples below.

## MULTIPLE POSTURES ON A SINGLE SPRITE SHEET

A sprite sheet with different "sprite" sets that correspond to different "postures": this is the case for the walking woman we just saw in the previous lesson. This sprite sheet contains 8 different sets of sprites, each corresponding to a direction. In this example, each posture is made of exactly 13 sprites, aligned in a single row.

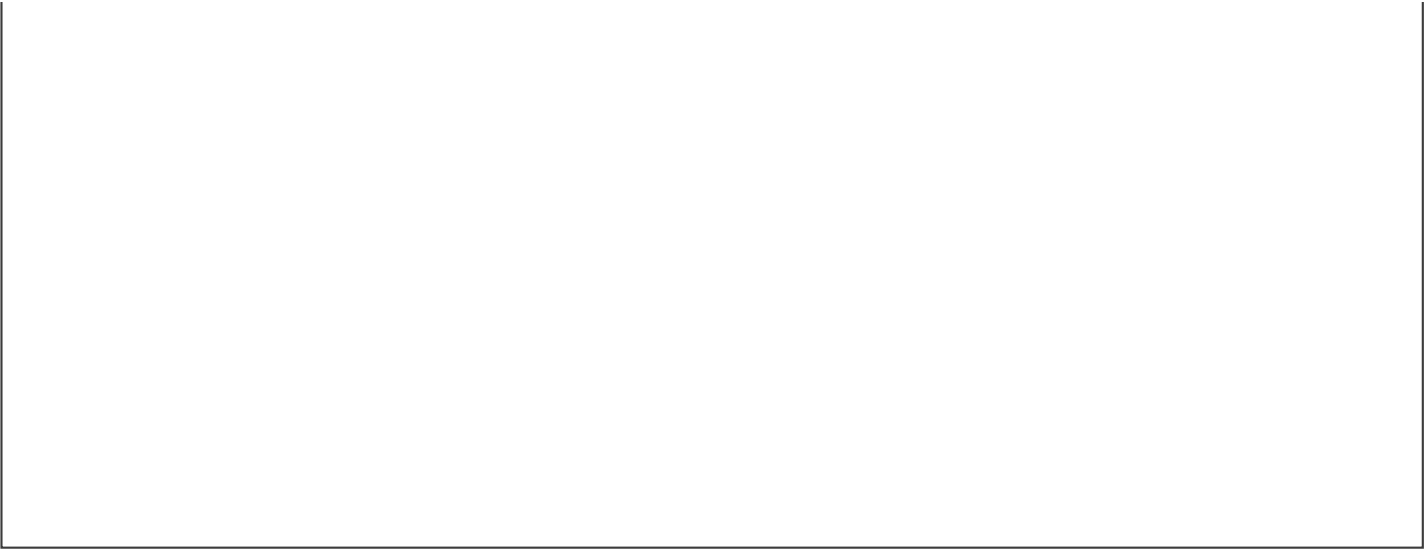

## ONE POSTURE PER SPRITE SHEET

We can also have a sprite sheet with sprite sets that spread over multiple lines, like this walking robot:

This is an example that you will see a lot around the Internet, in many sprite sheets. For the full animation of the robot, we will need multiple sprite sheets: one for each posture. Here is the "jumping robot" sprite sheet:

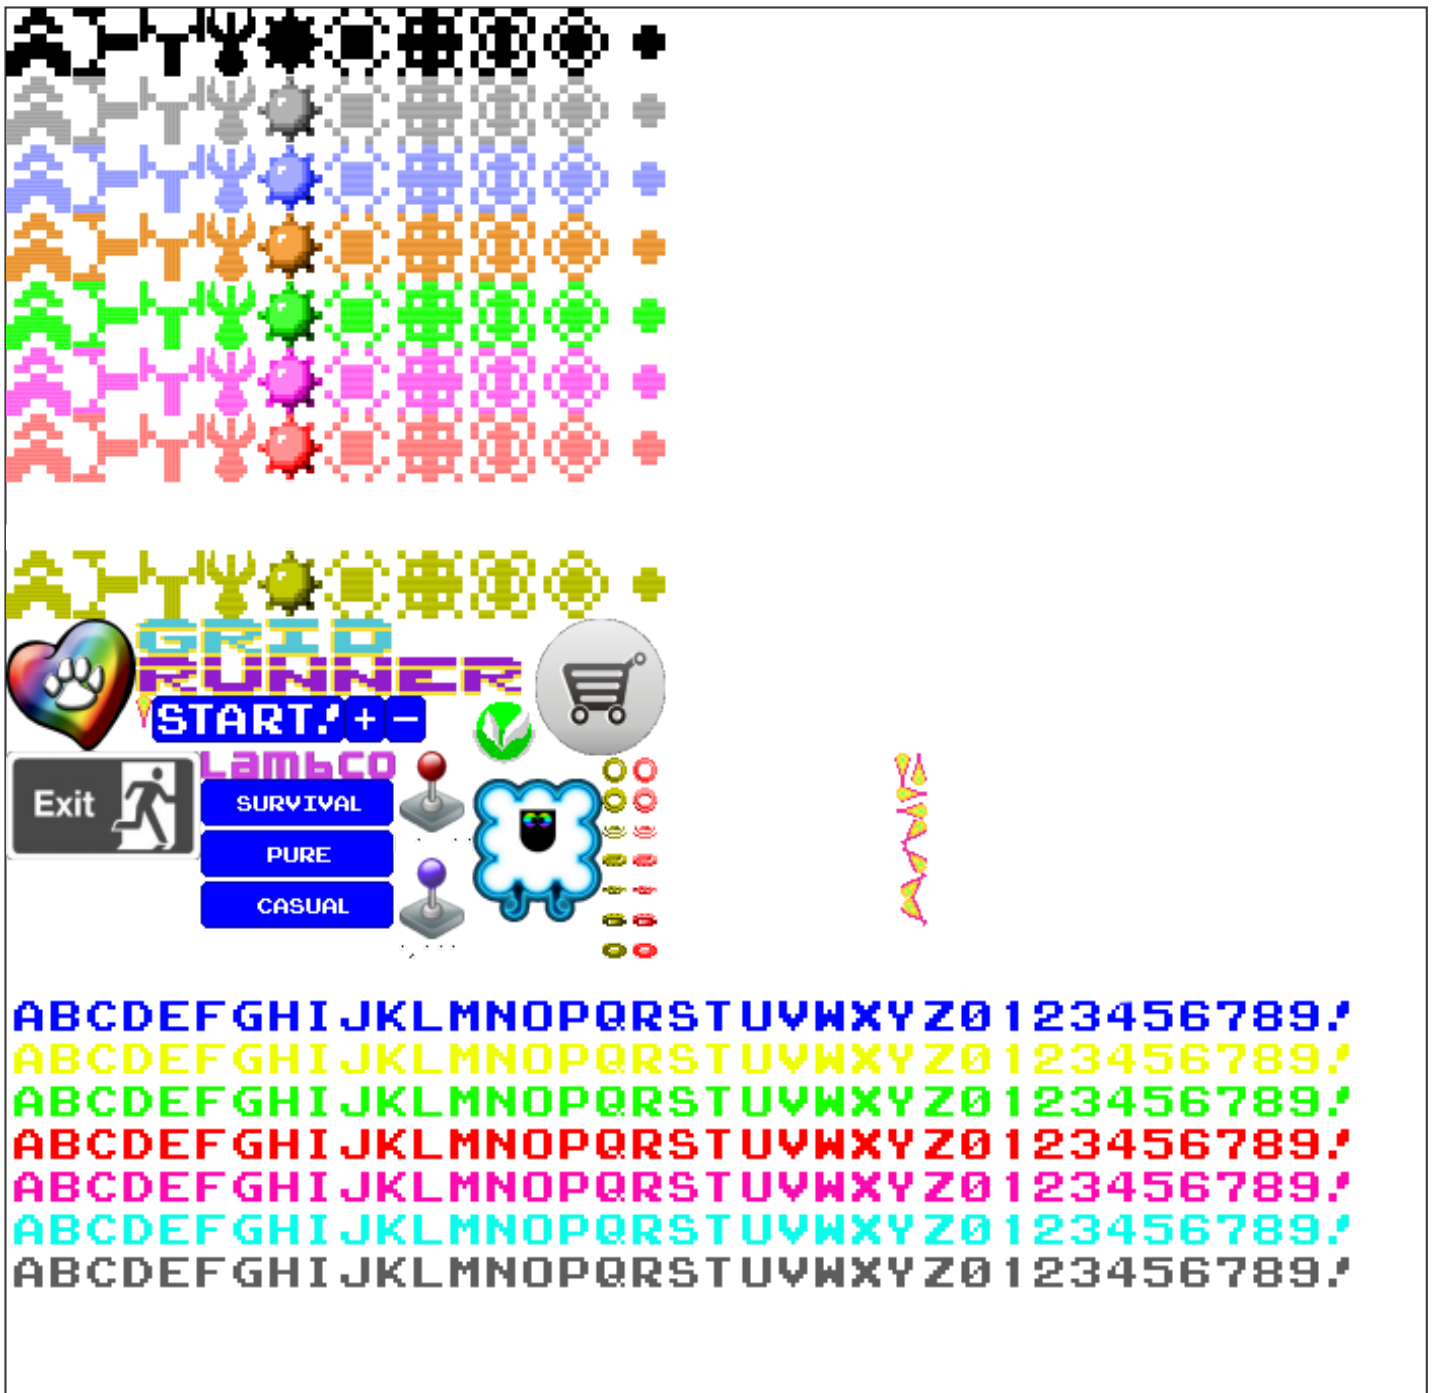

Whereas the walking robot posture is made of 16 sprites, the jumping robot is made of 26!

## HYBRID SPRITE SHEETS

You will also find sprite sheets that contain completely different sets of sprites (this one comes from [the famous Gridrunner IOS game by Jeff Minter](#)):

So, when we think about writing a "sprite engine", we need to consider how to support all these kinds of sprite sheets.
